

# The Alcalá building

Alban STEFF

# Introduction Sensors and Data

Two types of sensor technologies are installed in this building:

**Wi-Fi sensors and smart meters.**

*2 + 1 datasets generated :*

- Electrical energy consumption*
- Wifi visits*
- Weather data of Madrid*

# Let's start with problem 1

“Summarize electrical energy consumption and Wi-Fi visits over various windows of time”

# Wifi visits Daily, weekly, monthly

Wifi visits  
What is the  
distribution of the  
visits over the days  
of the week  
(Monday to Friday)?

# Wifi visits

What is the distribution of the visits over the weekend ?

# Wifi visits Summary

# Energy consumption Daily, Weekly, Hourly

# Energy consumption during the weekdays

# Energy consumption during the weekend

Let's go for  
problem 2 !

“Compute daily heating/cooling degree days.”

# Degree days

## Plot the Heating Degree Days (HDD)

# Degree days

## Plot the Cooling Degree Days (CDD)

# Let's go for problem 3 !

“Expose statistical relationships between the variables”

# Statistical relationships Temperature variations with time

# Statistical relationships HVAC energy consumption and number of visits

# Statistical relationships

## Elevator energy consumption and number of visits

# Statistical relationships

## Elevator energy consumption and HVAC energy consumption

# Statistical relationships HDD, HVAC energy consumption and number of visits

# Statistical relationships

## CDD, HVAC energy consumption and number of visits

# Let's go for problem 4 !

“Can we optimize the energy consumption of the HVAC system and the building thermal comfort ?”

# Optimization for HVAC system

Is the data provided sufficient to start optimizing the energy consumption of the HVAC system and thermal comfort ?

Suggest possible actions to undertake in order to reduce the energy consumption of the HVAC system while maintaining or improving thermal comfort.

What other variables should be measured in order to realize this goal ?

**Legend :**  
**Center :** unrelated to HVAC energy consumption  
**Extremity :** related to HVAC energy consumption

# Let's go for problem 5 !

“Can elevator data be used to estimate the number of times people entered the building over a given period ?”

Elevator data alone

To what extent can elevator data alone be used to estimate the number of times people entered the building over a given day ?

Elevator data and visits

Is it possible to estimate the number of times people entered the building over a given hour using available data?

Example

We can use wifi visits to estimate the amount of persons inside the building at a given hour. The following code is an example :

```
550 energy_for_one_day = elevator['consumption'][0]
551 energy_at_this_hour = eec['energy_consumed'][16]
552 visits_for_one_day = wifi['visits'][0]
553 persons_inside = int((energy_at_this_hour / energy_for_one_day) * visits_for_one_day)
554 date = str(eec['local_time'][16].year) + "-" + str(eec['local_time'][16].month) + "-" + str(eec['local_time'][16].day)
555 print("Persons inside on the : " + date + " at " + str(eec['local_time'][16].hour) + "H : " + str(persons_inside))
```
